

**LISTING OF THE CLAIMS**

1. (Currently Amended) An inhaler for the administration of a pharmaceutical composition, comprising:

a mouthpiece,

an air channel opening into the mouthpiece and optionally a chamber which may optionally be provided with an air inlet channel or an air opening, wherein the inhaler is capable of receiving: a) a capsule with the composition, b) a blister pack with the composition, or c) a conveyor belt holding the composition ; and

a plurality of cells having sloped and/or tapered parabolic-shaped elevations and/or depressions in a repeating pattern of an egg-carton arrangement, the elevations and/or depressions having a height/depth of from 0.1 to 100 microns on at least part of the inner surface of the mouthpiece, the air channel, and/or the chamber using one or more of microtechnology, nanotechnology, subtractive treatment, and additive treatment, so that the inner surface(s) of the inhaler may be kept clean without affecting the delivery characteristics of the composition.

2. (Previously Presented) The inhaler according to claim 1, the plurality of cells on the inner surface of the mouthpiece, the air channel and/or the chamber using covers over at least 20% of the surface thereof.

3. (Previously Presented) The inhaler according to claim 1, wherein the elevations and depressions are separated by spacings in the range from 0.1 to 200 microns.

4. (Previously Presented) The inhaler according to claim 1, wherein the inner surfaces are formed by hydrophobic materials selected from one or more of glass, ceramics, metals and plastics, wherein the plastics are further selected from one or more of polyethylene, polypropylene, polycarbonate, polyacrylate, polyester and silanes.

5. (Previously Presented) The inhaler according to claim 1, wherein the inner surfaces are formed by processes comprising subtractive or additive treatment selected from stamping, etching, laser ablation, galvanic machining, adhesively attaching a structured film, adhesion of a powder, spraying with suspensions, and depositing sublimates.

6. (Previously Presented) The inhaler according to claim 1, wherein the inhaler is a Bernoulli inhaler.

7. (Previously Presented) The inhaler according to claim 6, further comprising a capsule chamber connected to the air channel opening in the mouthpiece.

8. (Previously Presented) The inhaler according to claim 7, wherein the capsule chamber has a diameter 1.1 to 2.5 times the capsule diameter and a length 1.02 to 2 times the length of the capsule.

9. (Previously Presented) The inhaler according to claim 7, further comprising a cutting device with at least two sharp spikes and/or cutters, the spikes and/or cutters being inserted through openings into the capsule chamber(s).

10. (Previously Presented) The inhaler according to claim 6, wherein the inhaler comprises a) a cup-shaped lower part open at the top, b) a plate which covers the opening of the lower part and perpendicularly to which is formed the capsule chamber, a button movable counter to a spring on the capsule chamber, comprising two sharp spikes or cutters for opening the capsule, c) an upper part with the mouthpiece and the air channel which connects the mouthpiece to the capsule chamber so as to be able to convey a powder or liquid or aerosol, and d) a lid, the elements a), b) c) and d) being joined together by a common hinge element such that they can be moved back and forth relative to one another.

11 - 22. (Cancelled).
